# A Robust and Scalable Optimisation Framework for Distributed Energy Resources

Dr Meagan Burke, Daniel Garrett, Dr Nicholas Good, Dr Steve Wattam, Dr Shemaiah Weekes, Csaba Zagoni

# About Upside

Award-winning cloud platform, using advanced algorithms and artificial intelligence to manage and monetise very large portfolios of diversified and distributed energy assets.

# Outline

## Optimisation Framework

- The challenge and opportunity
- The optimisation framework
- Capabilities and applications

## Research Application Example

- Outline of the HAVEN project
- Optimisation framework applied to a V2G-enabled domestic energy system
- Dispatch example and results

# The Challenge

Energy system is evolving and presents new challenges for System Operators and Suppliers.

Increased variable and distributed generation present system balancing challenges

Increased electrification of heat and transport impact time and magnitude of demand

Pressures to reduce carbon intensity and consumer cost

**Solutions required which can utilise flexible assets in an optimal way to meet these needs.**

# The Opportunity

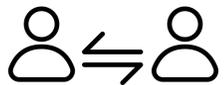

Optimal asset control and dispatch can open up new revenue streams and business models, and support increased deployment of renewables.

Direct revenue streams (e.g. energy trading, reduction in UoS charges)

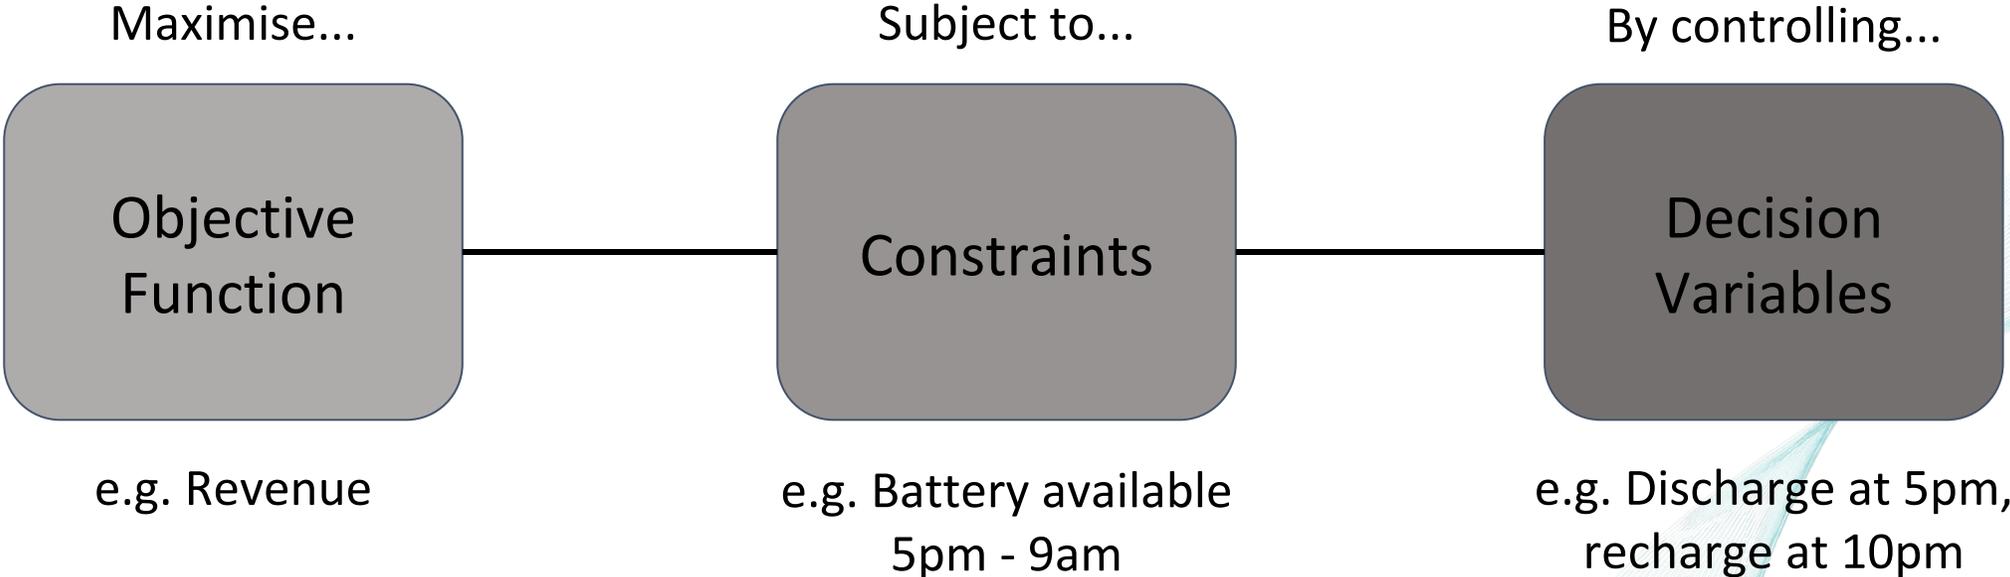

Grid services (e.g. balancing services, frequency response, constraint management)

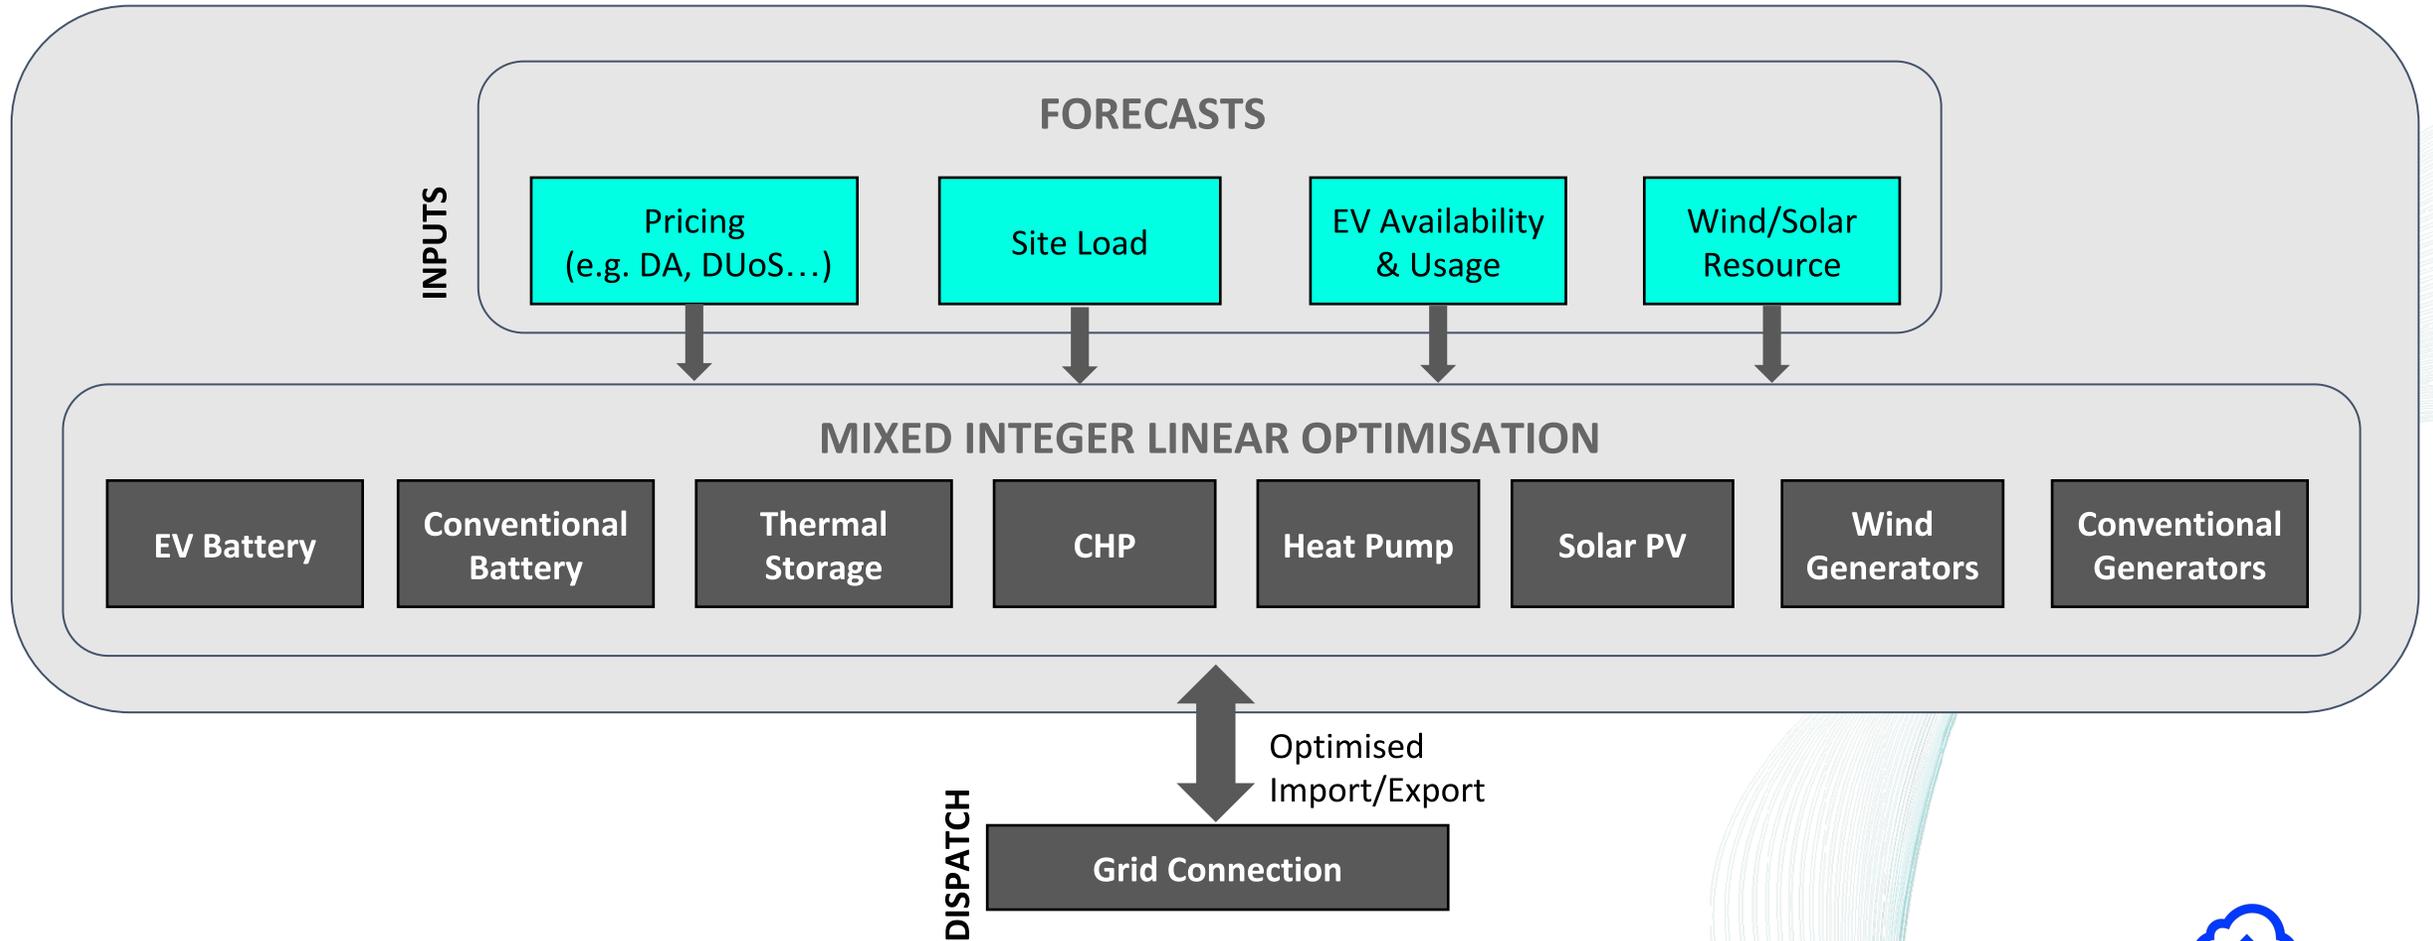

Local energy markets and increased value from distributed renewables

**Requires intelligent systems that optimise multiple assets against competing revenue streams, subject to constraints.**

# Mixed Integer Linear Program

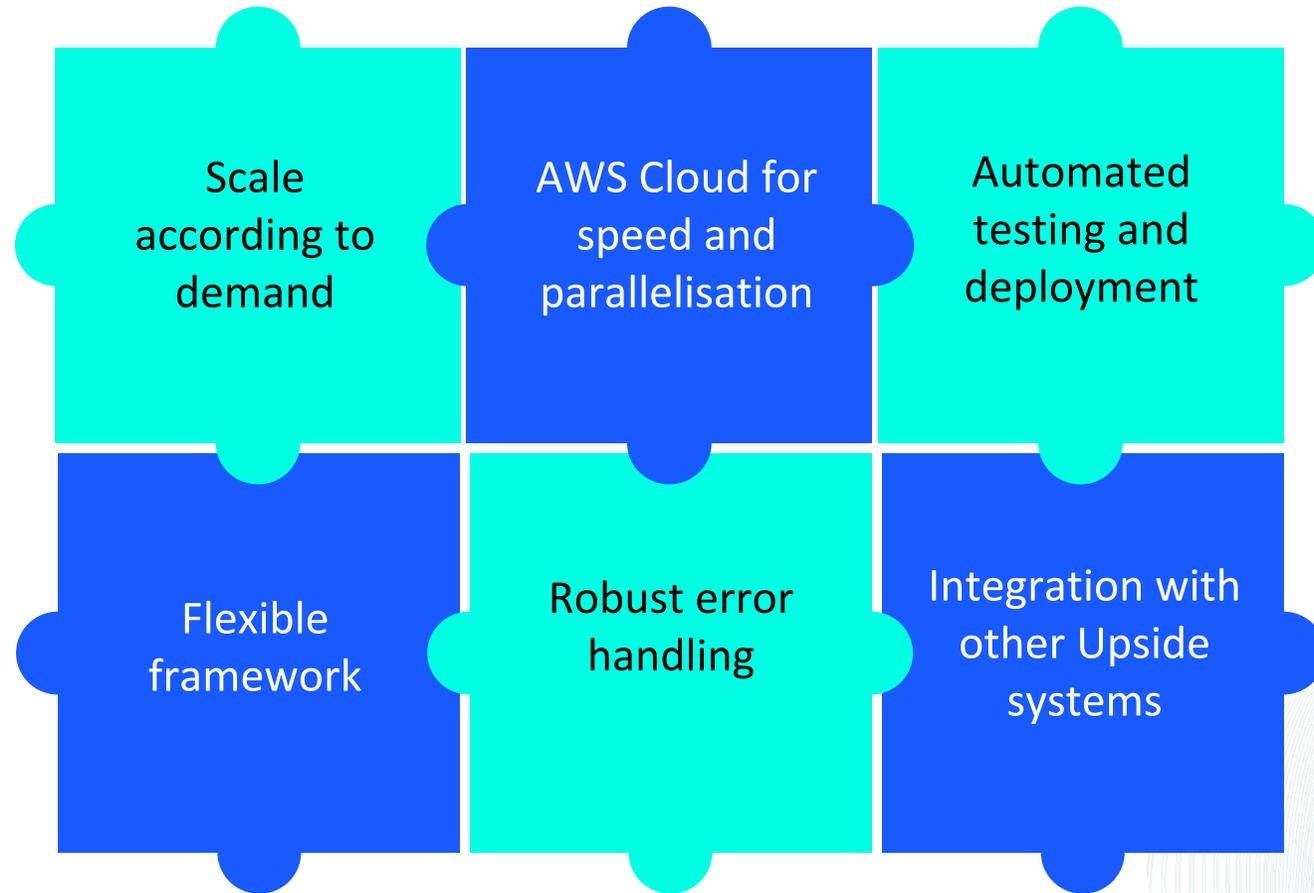

# Upside Optimisation Framework (snap)

# Capabilities

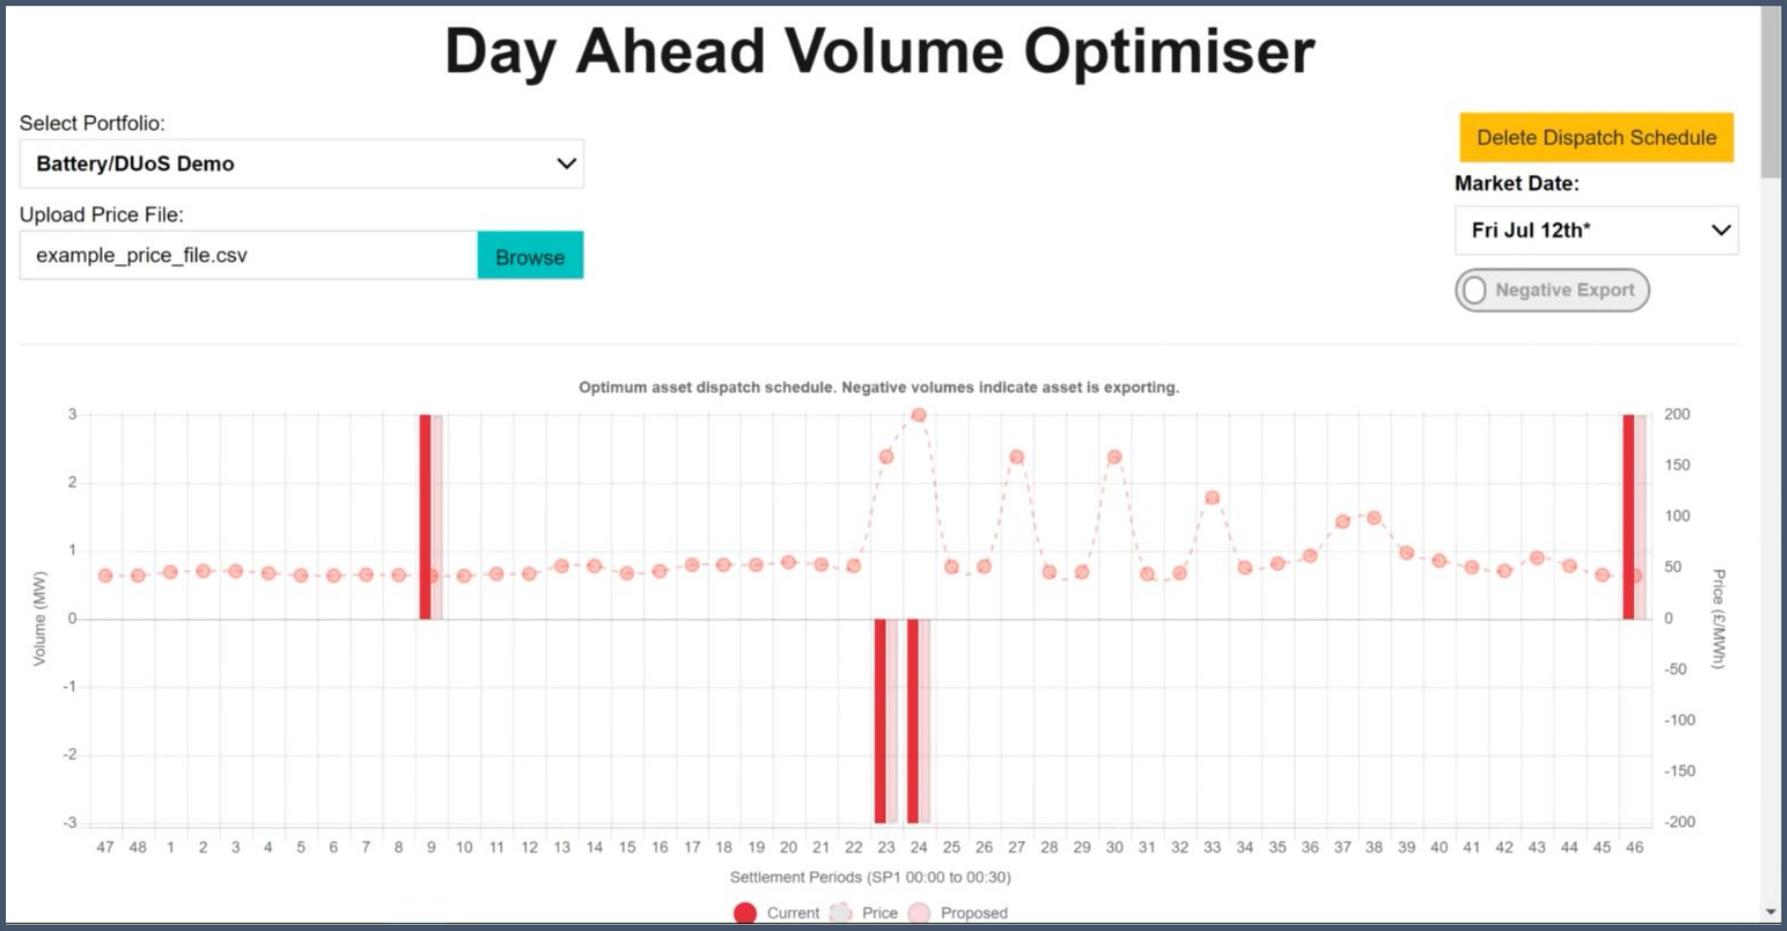

Production-grade framework deployed in commercial and research projects.

The image is a composite of two scenes. The top half shows a wind farm with several three-bladed turbines on a grassy hill under a clear sky. The bottom half shows a close-up of solar panels in a field. A glowing blue wireframe arch, resembling a stylized 'A' or a protective shield, is superimposed over the entire scene, framing the text and the turbines. The text is in a bold, yellow, sans-serif font.

Applications  
Commercial & Research

# Applications - Commercial

# Applications - Research

## HAVEN (Home as A Virtual Energy Network)

One-year project examined the value V2G/V2H enabled EVs could provide in the context of a domestic home energy network of storage and generation assets.

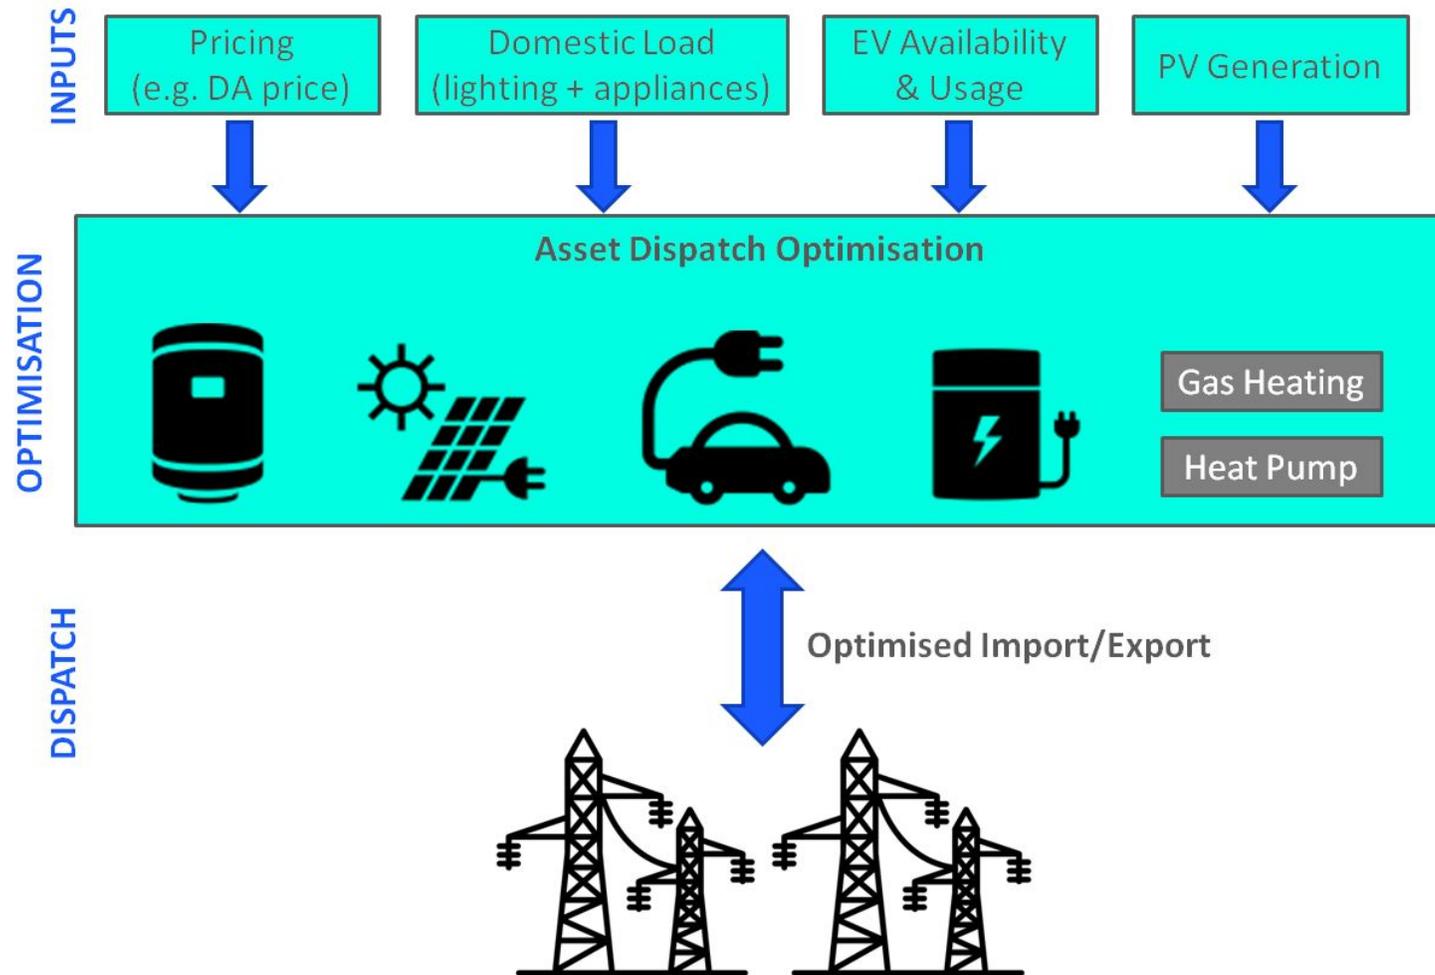

University of  
**Salford**  
MANCHESTER

**HONDA**  
The Power of Dreams

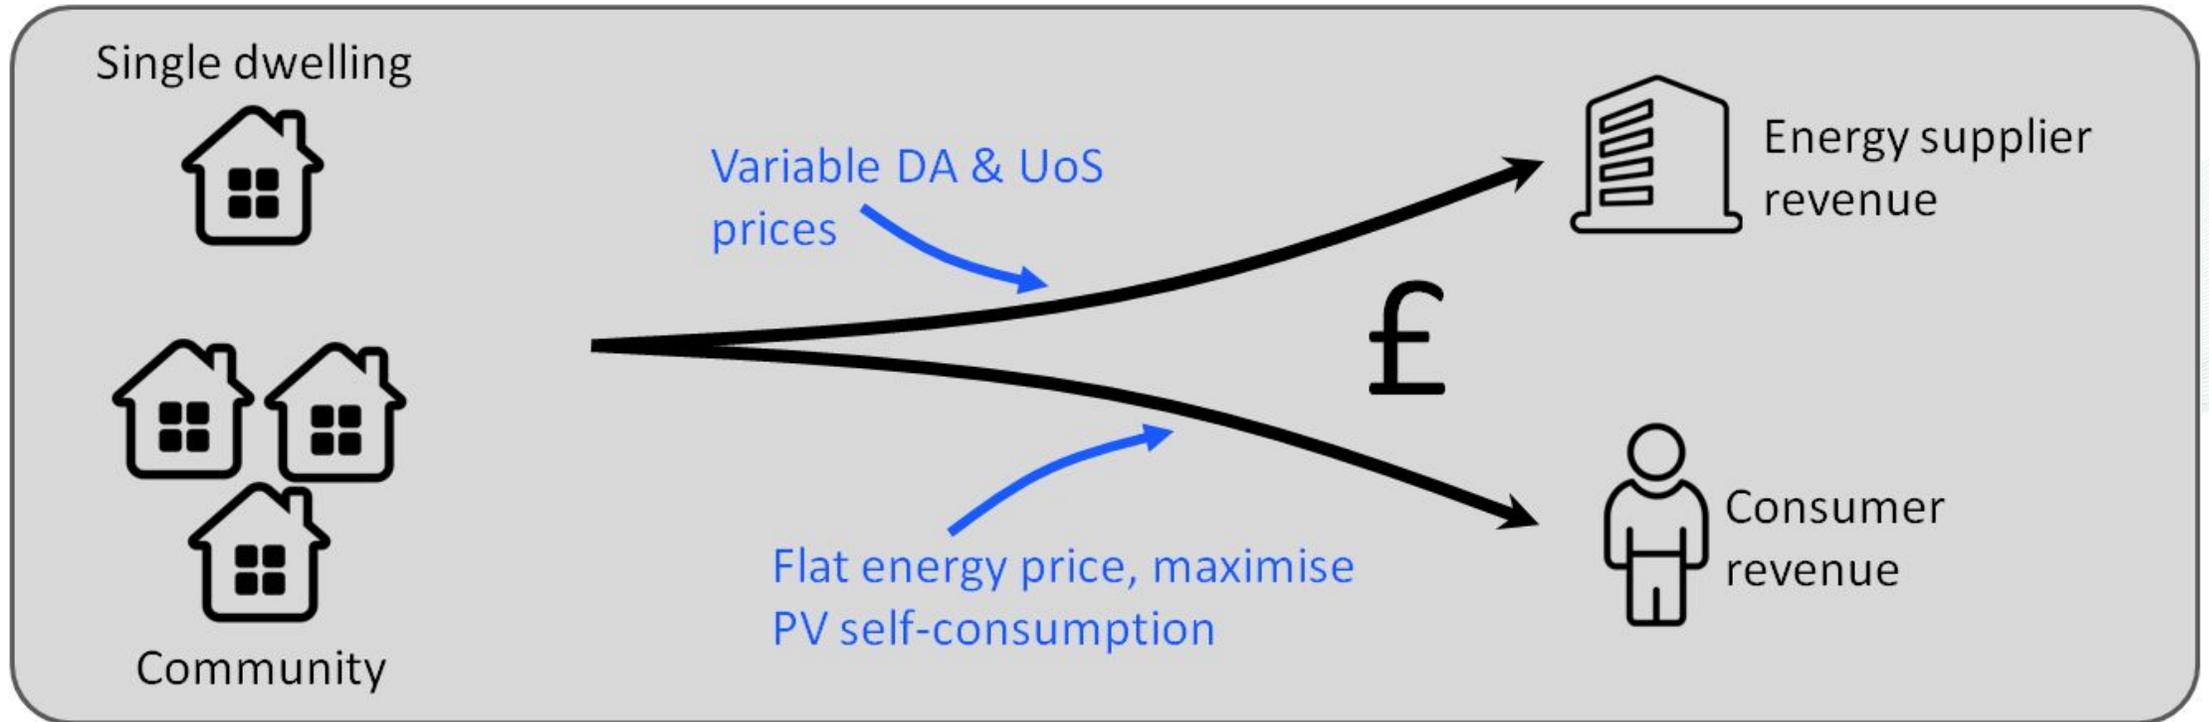

Innovate UK

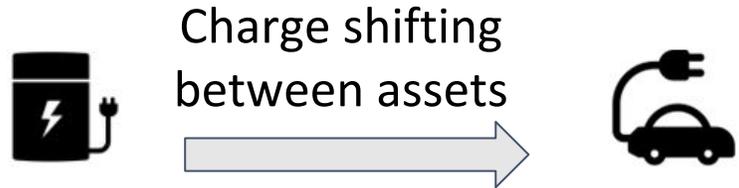

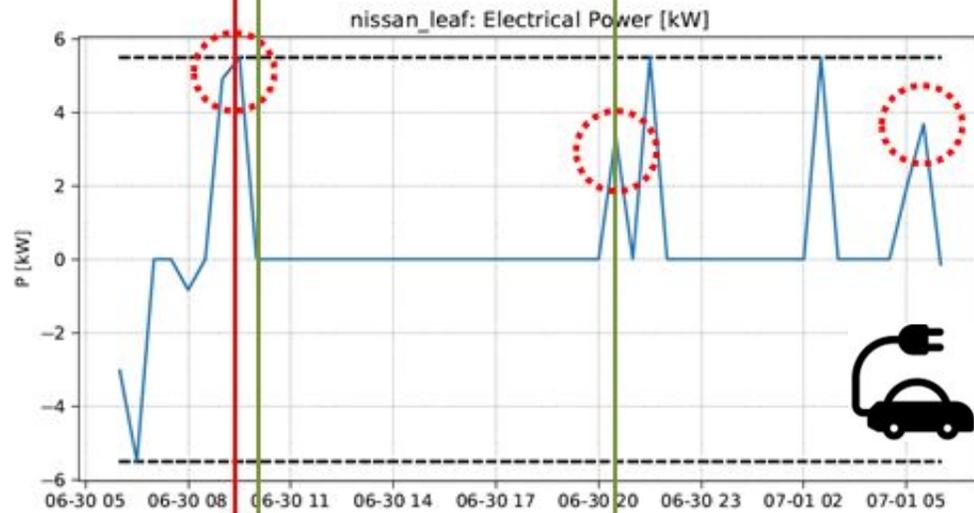

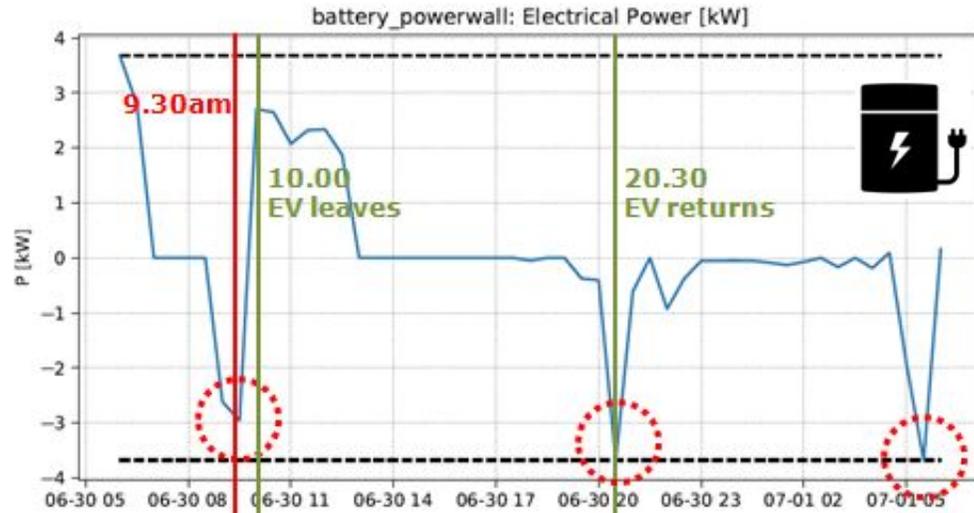

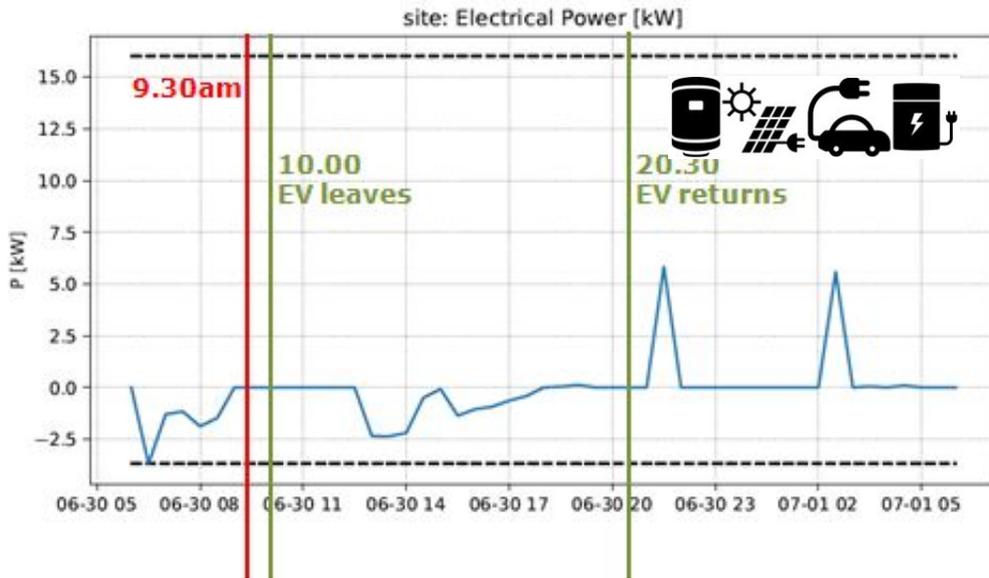

# Framework Applied to HAVEN

# Supplier or Consumer Revenue

# Example Dispatch - 24hr period

Charging overnight to reduce energy and UoS costs.

# Financial Results - per customer

Energy supplier revenue per annum (DA + UoS)

Consumer revenue per annum (self-consumption of solar PV)

# Summary

- Upside have developed a robust and scalable optimisation framework for distributed energy resources.
- The framework is currently used in commercial applications and large-scale research projects.
- We welcome research collaborations and expressions of interest as we grow our team.
